WORK EXPERIENCE

LOGESYS SOLUTIONS | Senior Python Developer — Bangalore, IN | Mar 2025 – Present

- Built the **Hub**, Fortegra's central identity and access platform, using **FastAPI**, **React/TypeScript**, and **Microsoft Entra ID**; shipped an app launcher (Access Admin, SWIFT Transact, PIMO) behind **Azure Front Door** and **APIM** as a single-origin gateway, deployed with **GitHub Actions** CI/CD.
- Designed two-axis authorization (**Entra app roles** for app admission, group-based **RBAC** in **PostgreSQL** with per-query data filters) and an admin console for onboarding, group membership, role mappings, and audit history that removed manual database edits.
- Federated an **Entra External ID** tenant with the corporate workforce tenant via **OIDC** so employees sign in under existing **Conditional Access** and **Duo MFA**, which B2B guest access would have bypassed; automated pre-provisioning with **Microsoft Graph**.
- Migrated authentication from cookie sessions to stateless **RS256 JWTs** with a **JWKS** endpoint and pinned algorithm, adding rotating refresh sessions with reuse detection so SWIFT validates users without per-request Hub calls.
- Secured the Hub's **Snowflake** service account with **RSA key-pair authentication** and debugged production failures using **Application Insights** and **KQL**.
- Built a **Databricks (Spark)** pipeline to migrate **6 million** policies from **Snowflake** to **InsureMo** via REST API with batching, concurrent workers, retries, and failed-record logging; fixed a driver out-of-memory failure by chunking batches and tuned throughput with connection pooling and payload caching.
- Built and published **Auto Insights**, a **Flutter** app on the Play Store and App Store; also delivered an internal **FastAPI** social platform and **Streamlit** apps on **Snowflake**.

VUMONIC DATALABS | Software Engineer — Bangalore, IN | May 2021 – Dec 2024

- Architected the backend for a data pipeline SaaS solution using **Python**, **PostgreSQL**, **Apache Kafka**, and **Google Cloud Storage (GCS)**, automating processing of 1TB of data and reducing 90% of manual effort.
- Spearheaded ETL operations for 500 enterprises, processing alternative data through workflows involving mapping, populating new columns, and advanced calculations.
- Reduced data validation time by 50% through a QC application built with **Python**, **Flask**, **Tailwind**, **JavaScript**, and **Pandas**.
- Developed a count tracking system using **Python** and **MongoDB** for real-time month-on-month metrics across 500 enterprises, cutting report generation time by 40%.
- Built an ML-based category classification model with 95% accuracy for email journeys using **Python**, **OpenAI APIs**, and **OCR**, later optimized with **Node.js**.
- Developed a brand extraction engine processing 1 lakh rows in 1 second using optimized data structures and algorithms.
- Engineered a PDF information extraction service using **OCR** and **ElasticSearch** for complex document analysis.

SKILLS

Languages: Python, TypeScript, JavaScript, SQL, KQL, Dart, HTML/CSS
Backend and APIs: FastAPI, Flask, Django, Pandas, Dask, Kafka, Selenium, BeautifulSoup
Identity and Security: Microsoft Entra ID / External ID, OAuth 2.0, OIDC, JWT (RS256, JWKS), RBAC
Cloud and DevOps: Azure (App Service, APIM, Front Door, Key Vault, Application Insights), AWS, GCS, GitHub Actions, Docker, Git
Data: PostgreSQL, Snowflake, Databricks (Spark), MongoDB, Elasticsearch, Clickhouse, Redis

EDUCATION

BSc. Computer Science — Tamilnadu, IN | May 2021
Bishop Heber College
